Map of World Trade

Source: Feenstra and Taylor (2011). Essentials of International Economics, Worth Publishers.

Trade is decreasing in distance

(c) France's exports (2006)

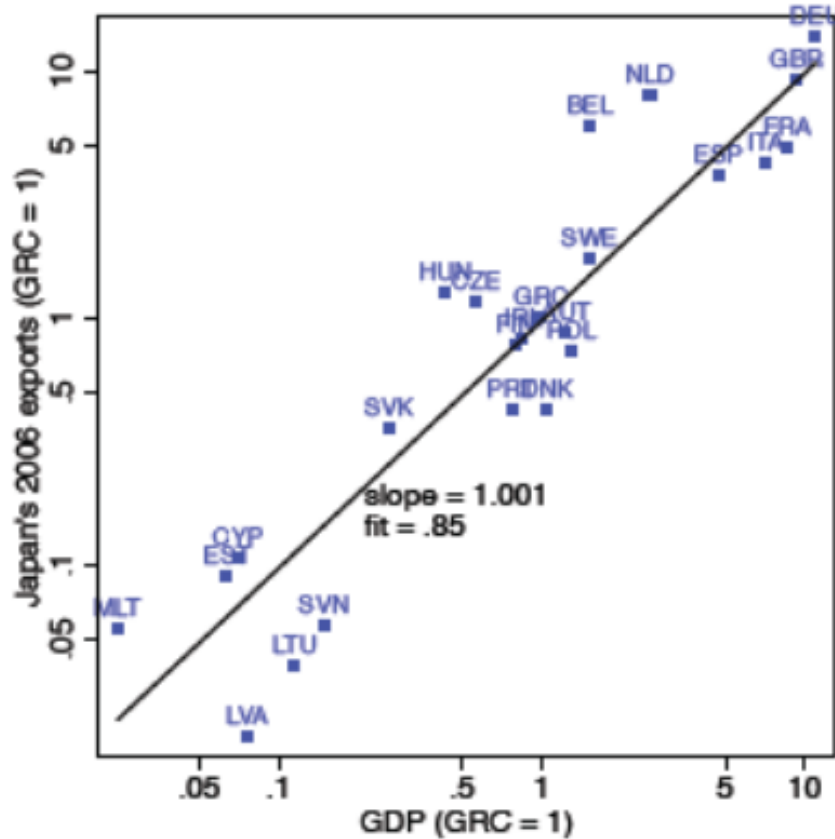

(d) France's imports (2006)

Trade is increasing in size

Measured by
national output

(a) Japan's exports to EU, 2006

(b) Japan's imports from EU, 2006

Great example from Japan:

Goodness of fit varies
between 75% and 85%.

Remember: This example is
a cross sectional data (at a
point in time, that is year
2006 is fixed).

Another example from the US economy

The Size of European Economies, and the Value of Their Trade with the United States

UN Comtrade Notice: Upgrade plan 2018.

All UN Comtrade-related dissemination sites will be gradually upgraded in 2018 to take advantage of new data items and features. A User Guide on the new features will be available soon in our website. Please visit <https://comtrade.un.org/doc/UpgradePlan> to see all the details.

Periods (year)

All or a valid period. Up to 5 may be selected.

Reporters

All or a valid reporter. Up to 5 may be selected. All may only be used if a partner is selected.

Partners

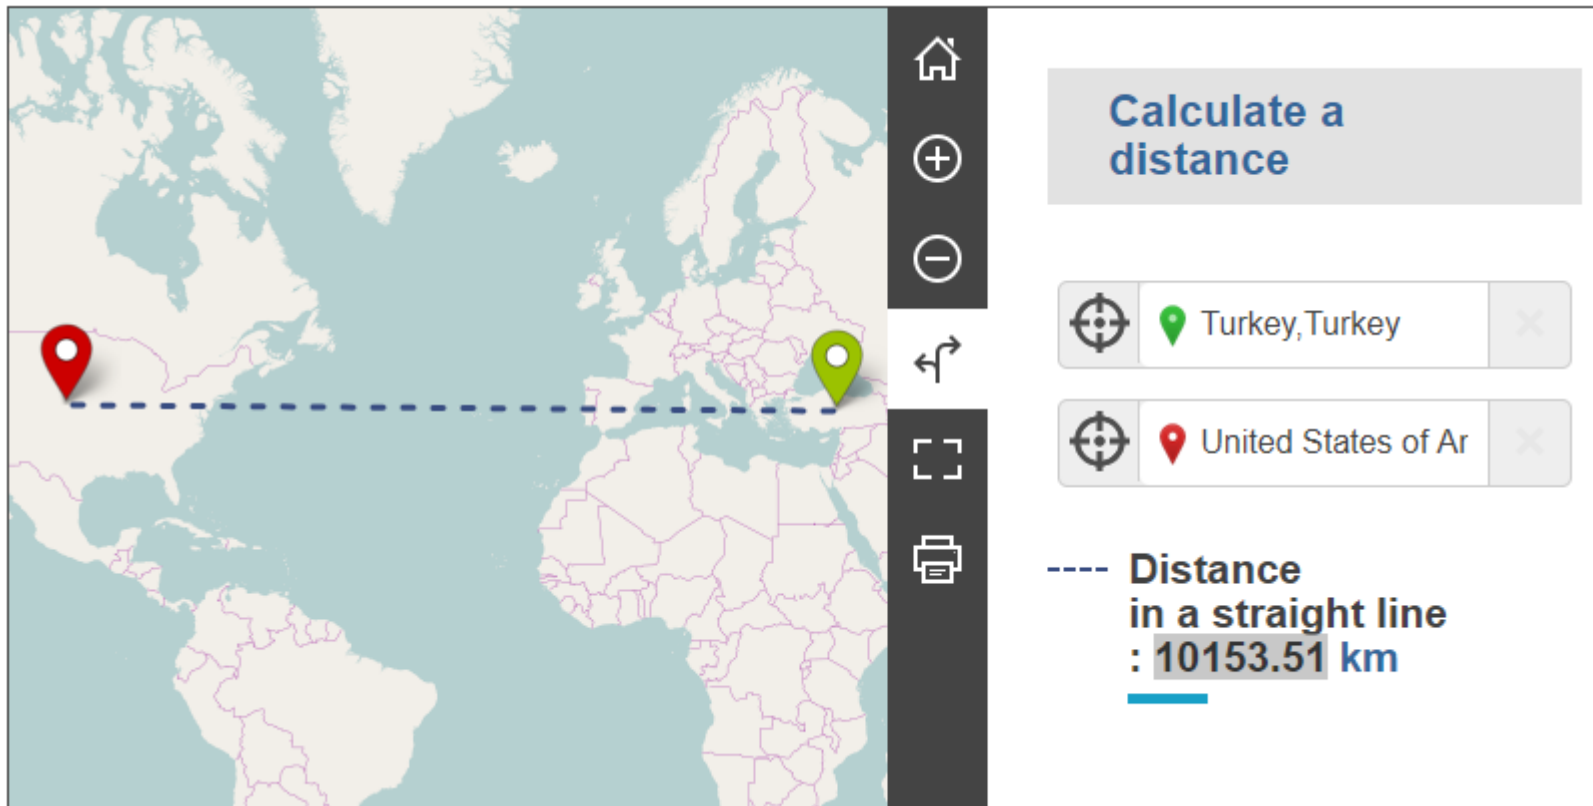

World, All, or a valid reporter. Up to 5 may be selected. All may only be used if a reporter is selected.

Trade flows

All or select multiple trade flows.

Data for distance:

- https://ec.europa.eu/programmes/erasmus-plus/resources/distance-calculator_en

Gravity Model

Jan Tinbergen (1962) states that the size of bilateral trade flows between any two countries can be approximated by a law called the “gravity equation” by analogy with the Newtonian theory of gravitation.

$$M_{ij} = \frac{Y_i Y_j}{D_{ij}}$$

Volume of
trade from
country i to
country j

GDP levels of
country i and
country j

Distance between
country i and
country j

Gravity model suggests that bilateral trade flows are increasing in the size (GDP) of the countries involved, and decreasing in the distance between them.

Size and Trade Summary Observations for Frictionless Gravity

- bilateral trade rises with the size of either trading partner
- countries further apart trade less

Trade Compared to GDP

- Countries with the highest ratios of trade to GDP tend to be small in economic size. Countries with the lowest ratios of trade to GDP tend to be very large in economic size.
- Trade and Trade/GDP is not the same

Top 10 list	Exports of goods and services (constant 2015 US\$)	2020	Exports of goods and services (% of GDP)	2020
1	United States	2.105427	Luxembourg	214.5268
2	Germany	1.587526	Hong Kong SAR, China	176.7431
3	United Kingdom	0.771112	Singapore	176.2409
4	France	0.708598	Djibouti	153.4432
5	Netherlands	0.69352	Malta	140.5805
6	Korea, Rep.	0.681978	Ireland	131.1126
7	Singapore	0.606705	Vietnam	106.1232
8	Hong Kong SAR, China	0.590884	Slovak Republic	85.7075
9	Ireland	0.549827	Belgium	80.57868
10	Italy	0.524542	Hungary	79.66272

Trade Costs

Empirical studies proxy trade costs with bilateral distance however there are several additional variables as no-frictions is not possible:

- Transportation costs
- Policy barriers (tariff and non-tariff barriers)
- Wholesale and distribution costs
- information costs (common language, other relevant cultural features such as colonial history)
- non-monetary barriers— regulation, licensing,...
- taste differences
- insecure contracts

What can be added to Gravity Model?

- language differences/similarity (dummy variables)
- former colonial ties (dummy variables)
- Population
- Trade agreements (dummy variables)
- Monetary unions (dummy variables)

- Gravity model is used for trade but also applies to migration and foreign direct investments. (physical movements can be more costly and bigger economic size can be more attractive)

Marshall-Lerner Condition

- $XR \uparrow \rightarrow TB \uparrow$ if $\epsilon_x + \epsilon_m > 1$ (mathematical proof)

A depreciation in the currency improves TB if import and export elasticities of demand sum to more than unity.

- $P_x \downarrow \Rightarrow X \uparrow$

- $P_m \uparrow \Rightarrow M \downarrow$

$\epsilon_x + \epsilon_m = 1 \Rightarrow$ changes in XR leaves BOP unchanged

$\epsilon_x + \epsilon_m < 1 \Rightarrow$ unstable foreign exchange market

- In nominal terms: $P_m \cdot M + P_x \cdot X$

$\epsilon_x + \epsilon_m > 1 \Rightarrow$ stable foreign exchange market

J Curve

CA after a Depreciation Shock (Impulse Response)
Source: Kappler et al. (2013)

Empirically it is observed that trade in goods are inelastic in the short run since:

- Consumer patterns do not change easily
- Trade contracts prevents flexibility

Hence, Marshall-Lerner condition is not met and a depreciation in the currency initially leads to a deterioration in the trade balance. But in the long run it improves.
